Sprint 1 Wireframes – Revision 2

Owner: Frontend Architecture, UI/UX, Responsiveness & Accessibility

A note on notation:

These wireframes use Delphi VCL component names (Label, Edit, Memo, Button, ComboBox, ListView, Image, TabControl) to tag each element, purely because that vocabulary is already familiar and precise. **The application itself is not being built in Delphi** – it is React, per the team's chosen stack. The tags only describe what *kind* of element something is, e.g. a real Edit tag here becomes an `<input>` in React, a Button tag becomes a `<button>`, and so on.

Plain text with no border is a **Label** – static, non-interactive. Anything boxed is interactive; the small «tag» in its top-left corner names its type.

Low-fidelity wireframes: boxes represent component type and position, not final visual styling.

Contents

1	Component Legend	2
2	What Changed in This Revision	2
3	Login / Register	3
4	Dashboard	4
5	Project List	5
6	Create Project	6
7	Edit Project	7
8	Project Detail	8
9	Entry Capture	9
10	Profile	10
11	Screens Beyond Sprint 1	11

1 Component Legend

Plain caption text

«Edit»
Single-line input

«Memo»
Multi-line input

«Button»
Clickable action

«TabControl»
Switches view

«ComboBox»
Dropdown select

«DateTimePicker»
Date / time input

«ListView»
Scrollable list of rows

2 What Changed in This Revision

- **[FIXED]** Login/Register – removed the sign-in/sign-up toggle text entirely; single “Continue with Google” Button, nothing else.
- **[FIXED]** Dashboard (populated) – removed the Archived count stat. Archived only becomes visible once the user is on the Project List page, not on the Dashboard itself.
- **[FIXED]** Persistent sidebar – every page past login now shows the same left sidebar (Dashboard / Projects / Profile / Settings), not just a top nav bar. Leaving Dashboard keeps the sidebar visible and highlights the current page.
- **[FIXED]** Project List – Search Edit and Filter Button placed at the top as one row, Active/Archived TabControl below that, full project ListView underneath.
- **[FIXED]** Edit Project – collapsed into a single popup/page, not two steps like Create. Which fields remain editable once entries exist is still a team decision, kept as a note rather than assumed.
- **[FIXED]** Project Detail – unchanged in structure, just now links to the single-popup Edit Project.
- Entry Capture – confirmed fine as-is, no changes.
- **[NEW]** Full Profile screen – this exists in Sprint 1’s confirmed stories but was not fully wireframed before; added properly now.
- **[NEW]** Statistics and Settings screens – previously only described in text. Now actually wireframed and placed at the end, clearly marked as outside Sprint 1, for your review only.

3 Login / Register

Digital Logbook

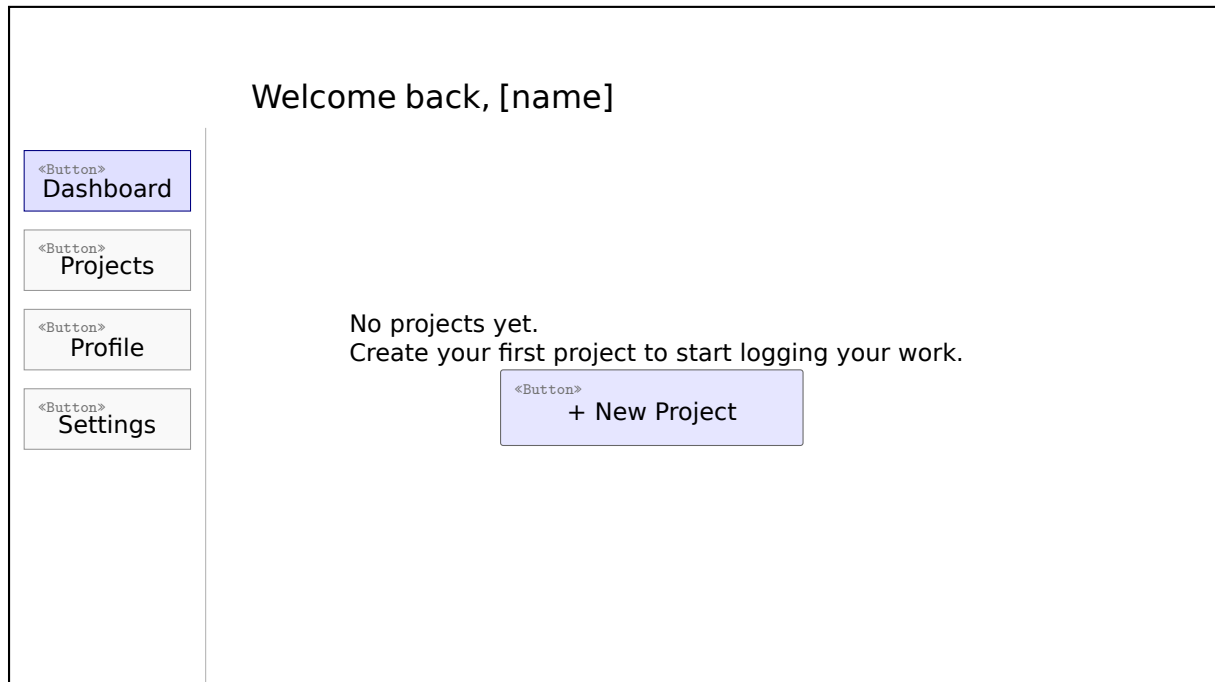

Keep track of every project, your way.

«Button» Continue with Google

What it does: one Button, nothing else. Auth0 handles the entire Google OAuth flow – there is no separate sign-in vs sign-up state to design for, and no password fields anywhere in this app.

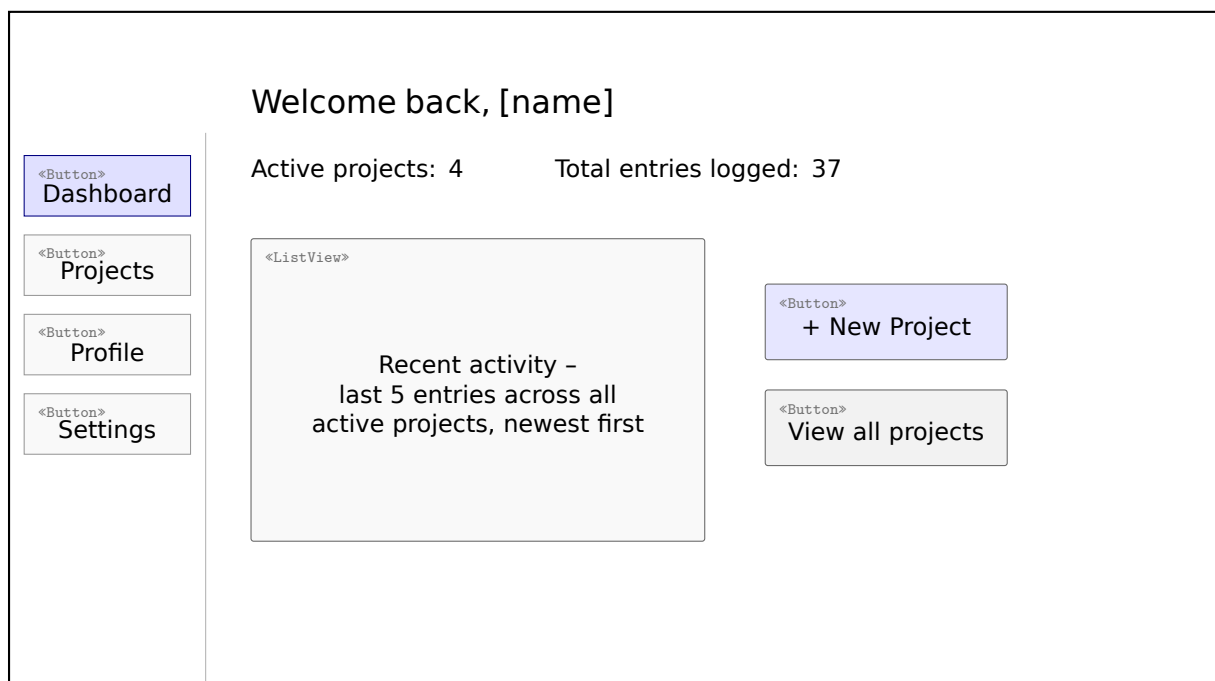

4 Dashboard

Dashboard – empty state, brand new user

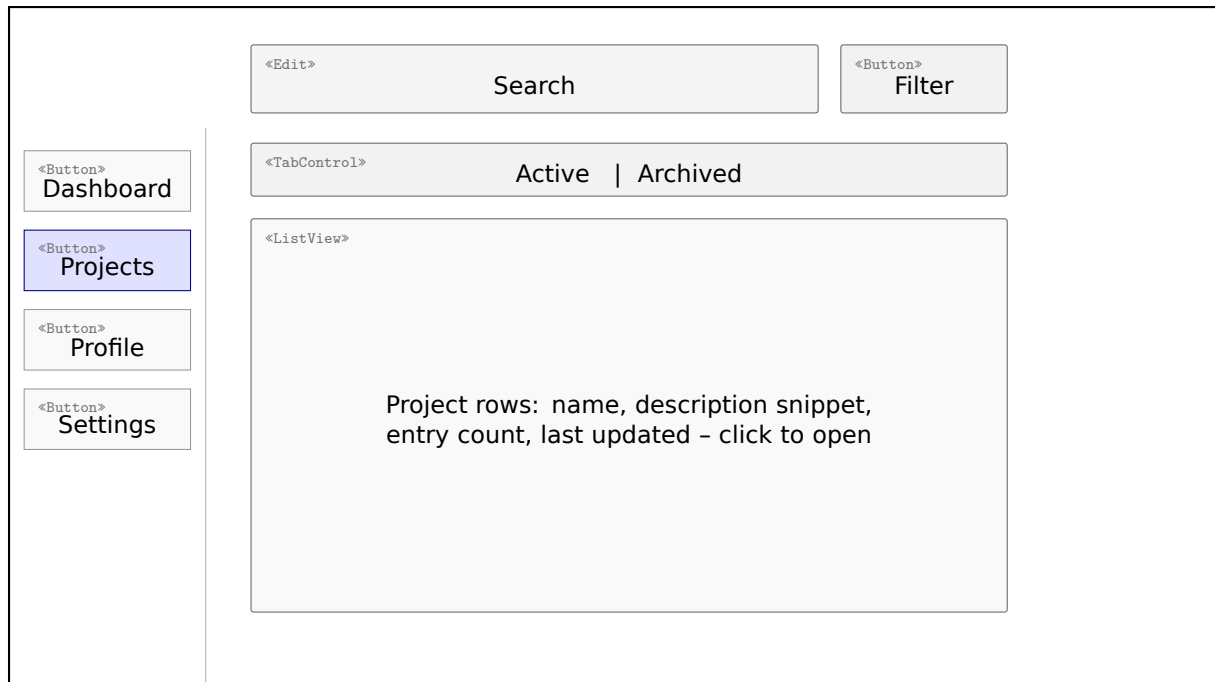

What it does: sidebar always present (Dashboard highlighted). No stats or recent-activity ListView shown yet – there is nothing to summarise until a project exists.

Dashboard – populated state

What each element does: the two stat Labels are plain text, read-only. Recent activity ListView shows entries only (project, entry title, when logged); clicking a row opens that project's detail page. "View all projects" Button is where Archived becomes visible, via the TabControl on the next screen – not here.

5 Project List

What it does: Search Edit and Filter Button sit in one row at the top, as sketched. The Active/Archived TabControl switches which set of rows the ListView shows underneath - archived projects remain fully visible and clickable here, they are never hidden permanently.

6 Create Project

Step 1 of 2 – project details (unchanged, confirmed fine)

«Edit»
Project name

«Memo»
Description (optional)

«Button»
Cancel

«Button»
Next: Define fields

Step 2 of 2 – define entry fields (unchanged, confirmed fine)

This project's entries will have these fields:

«Edit»
Field name

«ComboBox»
Text / Number
/ Date-time

«Button»
Remove

«Edit»
Field name

«ComboBox»
Type

«Button»
Remove

«Button»
+ Add field

«Button»
Back

«Button»
Create Project

7 Edit Project

[FIXED] single popup, not two steps like Create.

The form is enclosed in a black rectangular border. It contains several input fields and buttons. At the top is a wide text input field labeled 'Project name' with a small '<Edit>' icon in its top-left corner. Below it is a larger text area labeled 'Description' with a small '<Memo>' icon in its top-left corner. Under the description area, there is a row of three elements: a text input field labeled 'Field name' with a '<Edit>' icon, a dropdown menu labeled 'Type' with a '<ComboBox>' icon, and a button labeled 'Remove' with a '<Button>' icon. Below the 'Field name' input is a button labeled '+ Add field' with a '<Button>' icon. At the bottom left is a button labeled 'Cancel' with a '<Button>' icon. At the bottom right is a button labeled 'Save Changes' with a '<Button>' icon; this button has a light blue background.

Still open: exactly which fields stay editable once entries already exist against them. Noted for the next team discussion rather than assumed here.

8 Project Detail

Project Detail – empty, no entries yet

«Button» Dashboard «Button» Projects «Button» Profile «Button» Settings	«Button» Edit «Button» Archive
[Project name] [Description text] No entries yet – add your first one below. «Button» + Add Entry	

Project Detail – with entries

«Button» Dashboard «Button» Projects «Button» Profile «Button» Settings	«Button» Edit «Button» Archive
[Project name] [Description text] «Button» + Add Entry «ListView» Entry rows: values for this project's defined fields, newest first	

What each element does: Edit Button opens the single Edit Project popup (Section 5). Archive Button flips status and returns to Project List – nothing is deleted.

9 Entry Capture

Confirmed fine as-is, unchanged.

Log an entry for: [project name]

<Edit>

Field 1 (type-appropriate input)

<Edit>

Field 2

...one input per defined field

<Button>

Cancel

<Button>

Save Entry

What it does: form generated at render time from the project's defined fields. A `text` field renders an `Edit`, `number` renders a numeric `Edit`, `date-time` renders a `DateTimePicker`.

10 Profile

[NEW] confirmed Sprint 1 story, fully wireframed for the first time.

«Button»
Dashboard

«Button»
Projects

«Button»
Profile

«Button»
Settings

«Image»
Avatar

«Edit»
Bio

Joined: [date] (read-only)

«Edit»
Name

«Edit»
Username

«Button»
Cancel

«Button»
Save

What it does: avatar Image, editable Bio Memo/Edit, read-only join date Label, editable Name and Username Edits. Country/language fields from the original sketch are intentionally left out here – not part of Sprint 1's confirmed profile story.

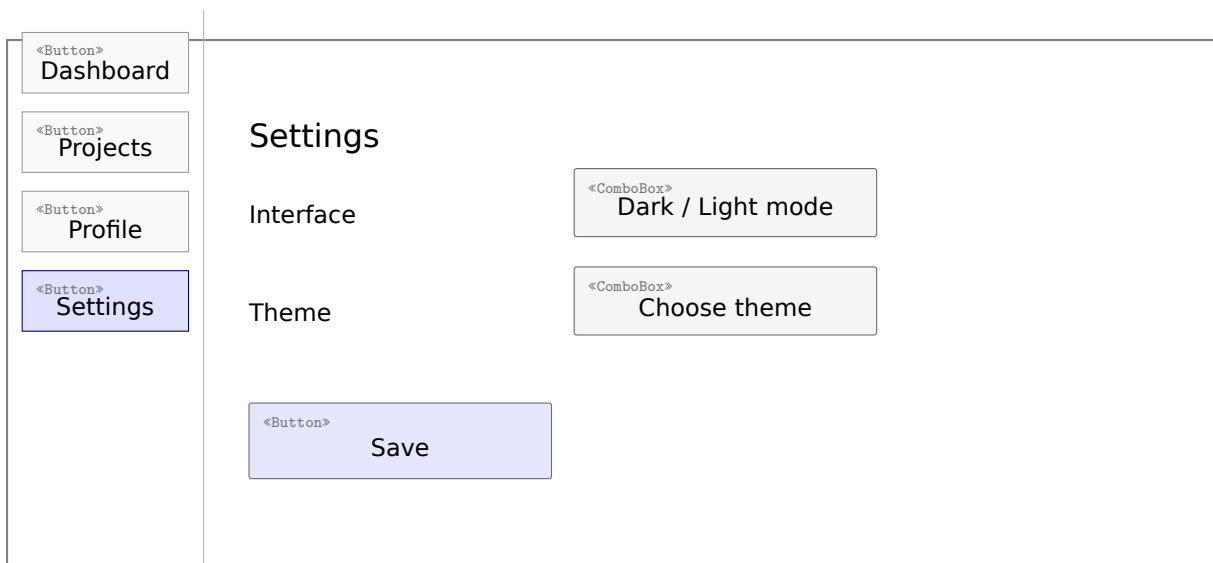

11 Screens Beyond Sprint 1

[**NOT SPRINT 1 - for review only**] the following are designed so you have something concrete to react to and refine, but none of this is scoped for Sprint 1. Do not build against these yet.

Statistics – Intermediate tier

Settings – not in Sprint 1 stories
